TIME

Time is difficult in programming. What is time anyways? Does it even exist?

TIME MODULE

```
import time
```

▶▶ Represents a time (hour, minute, second, microsecond) without a date component.

▶▶ Useful for working with time intervals and timing events.

▶▶ `time.time():` Returns the current time in seconds since the epoch (January 1, 1970, at 00:00:00 UTC).

▶▶ `time.sleep(N):` Pause for N seconds

▶▶ `time.perf_counter():` returns a floating-point number representing the time in seconds, with the **highest available resolution** for measuring small time intervals.
