Appending to a file

Lecture 7

Appending to a file

- **Appending** to a file means adding new content to the **end of an existing file** without overwriting its original contents.
- This is useful when you want to keep **adding** data to a file over time.
- To append to a file, you use the `open()` method with the mode `'a'`.
- This mode opens the file for appending, creating a new file if it does not exist.
- Then add text to the file **normally** using `write()` or `writelines()` methods.
- Remember to **close** the file afterwards.

File: `append.py`
